Archeon

[ARCHEON GUIDE]

How your records are de-identified

Before any AI company sees a record, Archeon removes or replaces the details that identify people, clients, projects and places. Your team does none of this work.

What comes out

- ✓ Names of people
- ✓ Email addresses and phone numbers
- ✓ Signatures
- ✓ Professional stamps and seals
- ✓ Client and owner names
- ✓ Your firm's name
- ✓ Consultants, contractors and suppliers
- ✓ Project names and numbers
- ✓ Street addresses and site locations
- ✓ Title blocks, headers and footers
- ✓ File metadata

Why names are replaced, not blacked out

A black bar breaks the thread. Archeon gives each person, company and project one stand-in across the whole archive, so an RFI still connects to its response and its change order. A buyer sees who did what and in what order, without learning who anyone was.

What stays

The technical content: the question in the RFI, the designer's answer, the spec section, the dates in order, the quantities and the cost of the change. That is what buyers pay for.

Checks before release

Every cleaned project is checked for leftover names before it can be released, and a project that fails is held back until it is fixed. Buyers also agree in writing never to try to re-identify records.

Left out entirely

Federal and security-sensitive work, protected health information, and anything a client contract restricts stay out of every license. Your firm can hold back any other records it chooses.
